

## CS 325 - Homework 5 - Solutions

1. (7 points 1 pt each) Let X and Y be two decision problems. Suppose we know that X reduces to Y in polynomial time. Which of the following can we infer? Explain

- a. If Y is NP-complete then so is X. False cannot be inferred
- b. If X is NP-complete then so is Y. False cannot be inferred
- c. If Y is NP-complete and X is in NP then X is NP-complete. False cannot be inferred
- d. If X is NP-complete and Y is in NP then Y is NP-complete. TRUE
- e. If X is in P, then Y is in P. False cannot be inferred
- f. If Y is in P, then X is in P. TRUE
- g. X and Y can't both be in NP. FALSE

2. (3 points 1 pt each) Two well-known NP-complete problems are 3-SAT and TSP, the Traveling Salesman Problem. The 2-SAT problem is a SAT variant in which each clause contains at most two literals. 2-SAT is known to have a polynomial-time algorithm. Are the following statements true or false? Justify your answer.

- a.  $3\text{-SAT} \leq_p \text{TSP}$ . TRUE – TSP is NP-complete so all problems in NP can be reduced to it in polynomial time
- b. If  $P \neq \text{NP}$ , then  $3\text{-SAT} \leq_p 2\text{-SAT}$ . FALSE. 2-SAT is in P
- c. If  $\text{TSP} \leq_p 2\text{-SAT}$ , then  $P = \text{NP}$ . TRUE. 2-SAT is in P

## CS 325 - Homework 5 - Solutions

3. **(10 points)** A Hamiltonian path in a graph is a simple path that visits every vertex exactly once. Show that  $\text{HAM-PATH} = \{ (G, u, v) : \text{there is a Hamiltonian path from } u \text{ to } v \text{ in } G \}$  is NP-complete. You may use the fact that HAM-CYCLE is NP-complete

**NP-Complete Proof - Prove that HAM-PATH is in NP-Complete**

**Step 1:** Show that  $\text{HAM-PATH} \in \text{NP}$  **3 points**

For an instance of HAM-PATH,  $(G, u, v)$ , and a “candidate solution” Hamiltonian path  $P$ , we can verify the solution in polynomial time by the following steps:

- Check the adjacency matrix (or list) of  $G$  to verify that there is an edge between every vertex in the path  $P$ . This takes at most  $O(V^2)$ .
- Check that every vertex is listed in  $P$  exactly once. This takes at most  $O(V^2)$ .
- Verify that  $P$  starts at  $u$  and ends at  $v$ . This takes  $O(1)$ .

Therefore the candidate solution can be verified in polynomial time.

**Step 2:** Show that  $\text{HAM-CYCLE} \leq_p \text{HAM-PATH}$  where  $\text{HAM-CYCLE} \in \text{NP-Complete}$  **7 points**

- Show a polynomial algorithm to transform **HAM-CYCLE** into an instance of **HAM-PATH**.

Given a graph  $G = (V, E)$  that is an instance of HAM-CYCLE create new graph  $G' = (V', E')$  such that  $G$  has a Hamiltonian cycle if and only if  $G'$  has a Hamiltonian path from  $(u, v)$ .

To create  $G'$

- Duplicate all the edges and vertices in  $G$  so that  $G' = G$  with  $V=V'$  and  $E=E'$ .  $G$  and  $G'$  now have the same adjacency list/matrix. This takes  $O(V^2)$ .
- Next select any vertex in  $V'$  to be  $u$ , create a new vertex  $v'$  and add  $v'$  to  $V'$ . Next for all edges  $(u, x)$  in  $E$  add the edge  $(v', x)$  to  $E'$ . Now  $v'$  will be adjacent to the same vertices as  $u$ . This can be completed in  $O(V)$  using either the adjacency list/matrix of  $G'$ .

Below is an example of the transformation.

## CS 325 - Homework 5 - Solutions

- b) Show that the graph  $G$  has a Hamiltonian cycle if and only if graph  $G'$  has a Hamiltonian path.

$\Rightarrow$  If  $G = (V, E)$  has a Hamiltonian cycle then  $G' = (V', E')$  has a Hamiltonian Path from  $u$  to  $v'$ .  
Suppose that  $G$  has a Hamiltonian cycle  $C$ . We can list the vertices in the cycle starting with  $u$  such that  $C = (u, v_1, \dots, v_k)$ . Since  $C$  is a cycle then there is an edge from  $(u, v_k)$  in  $E$  and in  $E'$ . By the construction of  $G'$ , the edge  $v'$  was added to  $G'$  such that it is adjacent to all edges adjacent to  $u$ . Therefore the edge  $(v_k, v')$  exists in  $E'$ , and the path  $P = (u, v_1, \dots, v_k, v')$  will be a Hamiltonian path from  $u$  to  $v'$  in  $G'$ .

$\Leftarrow$  If  $G' = (V', E')$  has a Hamiltonian Path from  $u$  to  $v'$  then  $G = (V, E)$  has a Hamiltonian cycle.

Suppose that  $P = (u, x, \dots, y, v')$  is a Hamiltonian path in  $G'$ . This implies that there is an edge from  $y$  to  $v'$  in  $G'$ . By the construction of  $G'$  there must have been an edge from  $u$  to  $y$  in  $G$ . Since  $v'$  is the only vertex in  $G'$  but not in  $G$ , it will not be in any cycle in  $G$ , we can let  $C = (u, x, \dots, y)$ . Since there exists an edge from  $y$  to  $u$  in  $G$ ,  $C$  is a Hamiltonian cycle in  $G$ .

Therefore **HAM-CYCLE**  $\leq_P$  **HAM-PATH**.

Since 1) and 2) are true. **HAM-PATH** is NP-Complete

## 4. Graph-Coloring. (10 points)

It has been proven that 3-COLOR is NP-complete by using a reduction from SAT. Use the fact that 3-COLOR is NP-complete to prove that 4-COLOR is NP-complete.

**Step 1: (3 points)** Show that 4-COLOR is in NP. Give a **polynomial** time algorithm to verify solution.

Given a Graph  $G=(V,E)$  and a 4-coloring certificate function  $c: V \rightarrow \{1, 2, 3, 4\}$  we can verify if  $c$  is a “legal” coloring function in polynomial time. To verify the solution, for each vertex  $u$  in  $V$  we must check the colors of the adjacent vertices. All colors of adjacent vertices must be different. If for any  $(u, w) \in E$ ,  $c(u) = c(w)$  then  $c$  is not a 4-COLORING of  $G$ . The verification of the 4-coloring is polynomial in  $n$  (the number of vertices) since  $4 \leq n$  and the time required to look at all edges in  $G$  is  $O(n^2)$ .

**Step 2: (7 points)** Show that there is a **polynomial** reduction from 3-COLOR to 4-COLOR.

a) Reduce an instance  $G$  of 3-COLOR to an instance  $G'$  of 4-COLOR in polynomial time, and show that there is a 3-COLOR in  $G$  iff there is a 4-COLOR in  $G'$ . Let  $G=(V,E)$  be an instance of 3-COLOR transform  $G$  into  $G'$  by adding a new vertex  $w'$  that is connect t every other vertex. That is

$G'=(V', E')$  where  $V' = V \cup \{w'\}$  and  $E' = E \cup \{(w', u) \text{ for all } u \in V\}$

This reduction can be done in polynomial time since we are adding one vertex and at most  $n$  edges

$G=(V,E)$

$G'=(V',E')$

blue = 1, yellow = 2, green = 3, red = 4.

b)  $G$  has a 3-COLORing if and only if  $G'$  has a 4-COLORing

$\Rightarrow$  If  $G$  has a 3-COLORing then  $G'$  has a 4-COLORing. Assume  $G$  has a 3-COLORing then there exists a function  $c: V \rightarrow \{1, 2, 3\}$  such that for all  $u, w \in V$  if  $(u,w) \in E$  then  $c(u) \neq c(w)$ . Now define the 4-coloring function  $c'$  for  $G'$

$$c'(u) = \begin{cases} c(u), & \text{if } u \in V \\ 4, & \text{if } u \notin V \text{ (} u = w' \text{)} \end{cases}$$

Therefore, if there is a 3-COLORing in  $G$  then there is a 4-COLORing in  $G'$

## CS 325 - Homework 5 - Solutions

$\Leftarrow$  If  $G'$  has a 4-COLORing then  $G$  has a 3-COLORing. Assume  $G'$  has a 4-COLORing, since  $w'$  is adjacent to all other vertices in  $G'$  then  $w'$  must be a different color. Let  $c'$  be the coloring function for  $G'$ , without loss of generality we can say that  $c'(w') = 4$  and  $c(u) \neq 4$  for all  $u \in (V' - \{w'\})$ . However,  $(V' - \{w'\}) = (V \cup \{w'\} - \{w'\}) = V$ . So we have colored all of the original vertices in  $V$  using only colors 1, 2 and 3 proving that  $G$  is 3-COLORable.

Therefore **3-COLOR**  $\leq_p$  **4-COLOR** and the 4-Color problem is NP-Hard

Since it was shown in Part 1 that **4-COLOR** is in NP, and by Step 2 NP-Hard, **4-COLOR** is NP-Complete.
